

# SATO V-TRAP

## CONNECTION SYSTEM

The twin outlet V-trap connection and sealing system helps to minimise odours by diverting waste to two offset pits and supports safely managed sanitation.

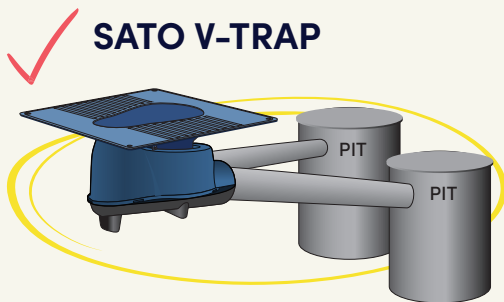

- Self sealing trap door to minimise odours and enhance user experience
- Saves water. The pan uses less than one litre per flush – 80% less than conventional toilet pans
- Simplifies both construction and the switching between two pits
- Visually appealing – its bright colour and unique award-winning design is a welcome addition to any twin pit
- Increased safety. Limited outlet aperture helps to prevent young children from falling into pits
- Easy and cost effective to install and maintain
- Sanitation for a lifetime – our 'trap door' mechanism has been tested to last the equivalent of 100 years of use by a household of five

### Features

- The V-Trap is designed to house the pan on top and two pipes to the side that directs waste to twin offset pits for waste collection
- When one pit is full, the innovative switching mechanism makes it simple and fast to change the outlet from one pit to another
- The V-trap replaces both the P-trap and the junction chamber to reduce complexity, installation time, and clogging
- There are different product solutions for India and Africa

### Advantages of V-Trap over conventional P-trap and diversion box system

Traditional traps can be expensive and complex to construct, requiring more space and water per flush. Often the diversion box can clog up and the switching mechanism is both complex and manual. This makes it difficult to build and maintain requiring the support of a skilled mason.

### CONVENTIONAL TRAP
